COMPANY & PRODUCT REVIEW — VERSION 3 — NOVEMBER 2026

TECHNOLOGY LANDSCAPE / VENDOR DUE DILIGENCE NOTE

Lumenore & Mojro

An independent review of two companies, their leadership, products and services, and the risks of buying from them

COMPANIES	**Lumenore Inc.** (Madison Heights, Michigan, USA): self-service BI and "agentic" conversational analytics **Mojro Technologies Pvt Ltd** (Bengaluru, India): logistics planning and optimisation
ASSESSMENT DATE	8 November 2026
METHOD	Company websites (with dated screenshots), published leadership biographies, company-registry and funding reporting, business-data directories, user-review platforms and contemporary press. No live product access, management interviews or reference calls.
WHAT IS NEW IN V3	Competitor analysis, market fit, the inferred technology stacks, strategic directions and further findings (Sections 5–9), plus a correction on Mojro's security claims. v2 added company profiles, leadership backgrounds, viability and pricing analysis, a risk register and website evidence screenshots.
AUDIENCE	Technology, operations, procurement and investment decision-makers

Decision status: preliminary. Headcount and revenue figures come from third-party directories that disagree with each other, and are shown as ranges with a confidence label. Claims about accuracy, savings, security and payback need direct validation in a controlled trial and through documents obtained under NDA.

Executive assessment

These are two small, founder-led companies selling into very different problems. **Lumenore** is a long-running BI product that grew out of the Netlink IT-services group and is now repositioning around conversational, "agentic" AI. **Mojro** is a lean, venture-backed Bengaluru start-up with an experienced ex-Mindtree founding team, named enterprise customers and a narrow, measurable value proposition in transport planning. For both, **the company is as much a risk as the product**. Buyers should assess vendor viability, support capacity and security assurance alongside features.

Dimension	Lumenore	Mojro
Company type	Product company spun out of Netlink's BI practice (2011). Private, apparently funded by the parent group; no venture rounds found.	Venture-backed start-up, incorporated May 2016. US$5.5m Series A reported April 2026 (IAN Alpha Fund lead).
Leadership	Founder & CEO Anurag Shrivastava (also listed as founder of Netlink). Nine-person leadership team published.	Three co-founders, each with 20–30 years' experience, mainly at Mindtree. Long-tenured senior team.
Scale (est.)	11–50 staff; ~US$5.6m revenue low confidence . "100+ teams" claimed.	~24–46 staff; revenue estimates range from ~US$0.7m (FY23) to US$10m low confidence . More than 60% of revenue from outside India.
Core offer	Ask Me (conversational analytics), Insights, Data Magnet (pipelines), plus CareGrid and IMPACT. Free tier; US$50/user/month paid tier.	PlanWyse (planning), ExecuteWyse (execution and visibility), GeoWyse. Sold as an optimisation layer on top of an existing TMS.
Strongest evidence	Public pricing and free tier; customer logos; small but positive review base (Gartner 4.6/5, n=15; Capterra 4.8/5, n=11).	Named testimonials from Godrej, HUL/Unilever and Akshayakalpa; independently reported funding; Microsoft Marketplace listing.
Principal risk	Conversational answers that are wrong or unauthorised; SOC 2 / HIPAA badges with no published evidence behind them; pricing well above incumbents; possible services-led model.	A small team supporting multinational clients across 5+ regions; security claims (SOC 2 Type II, ISO 27001) appear only on one page and need verifying; unverified performance and payback percentages.
Overall	AMBER Low-cost to trial; enterprise adoption needs governance and assurance evidence.	AMBER Strong, measurable proposition; vendor capacity and security must be proven before a commitment.

Risk summary by dimension

Risk dimension	Lumenore	Mojro
Product fit / differentiation	A Crowded horizontal BI market	G Clear buyer, pain point and metric
Evidence of claimed outcomes	A Vendor case studies only	A Named testimonials; percentages unverified

Vendor viability / financial	A Parent backing; small product revenue	A Modest capital; check filed accounts
Delivery and support capacity	A Parent's services bench may help	R ~40 staff across 5+ regions
Security and compliance assurance	A Badges claimed, no reports published	A SOC 2 Type II claimed (report under NDA); ISO wording inconsistent
Commercial predictability	A AI-credit consumption model	A Sales-led, opaque pricing
Key-person concentration	A Founder-led	A CTO also acts as CPO and head of US business

> **Bottom line.** Shortlist **Lumenore** where the problem is access to information and the free tier allows a cheap trial, but do not displace an established Power BI or Tableau estate on the strength of a chat interface. Shortlist **Mojro** where transport cost is material and an operation with many constraints can supply replayable data, but make the SOC 2 report, filed financial statements and a named support model preconditions of any pilot contract.

Changes from version 1

- **Added:** company profiles (legal entity, history, ownership, funding, scale), leadership and founder backgrounds with published LinkedIn links, a vendor-viability assessment, a pricing comparison, a risk register and website evidence screenshots.
- **Corrected (Lumenore security):** v1 said SOC 2 / ISO 27001 evidence was "not established". The website does display **AICPA SOC 2, HIPAA Compliant and GDPR badges** (Figure L2), but none link to a report, scope, auditor or trust centre, and the Security page only covers incident reporting. The gap is between a claim and its evidence, not an absence of claims.
- **Clarified (connectors):** Lumenore's own pages disagree. The homepage says "50+ data sources" and the pricing page says "100+ data connectors" (Figures L1, L4).
- **Clarified (Mojro payback):** the website claim is "value in 30 days" and "90 days for the tool to start paying for itself" (Figure M2). That is a *payback* claim, a stronger statement than v1's "value realisation within around 90 days".
- **Added (product scope):** Mojro's third product, GeoWyse. Lumenore's CareGrid and IMPACT product lines, and Ask Me's apparent early-access status.
- **Fixed:** the numbered steps in the trial sections now restart at 1.

Changes in version 3

- **Added:** market landscape and competitor maps (Section 5), market fit by segment (Section 6), inferred technology stacks (Section 7), strategic directions for each company and implications for buyers, partners and investors (Section 8), and further findings (Section 9).
- **Corrected (Mojro security):** v2 said Mojro published no security posture. Its Platform Capabilities page claims **SOC 2 Type II (report under NDA), ISO 27001 and US data residency** (Figure M6). The risk rating moves from red to amber, pending the documents.
- **Corrected (hidden placeholder):** the "Lorem ipsum" next to the 99.9% figure on Mojro's About page is hidden template markup that visitors don't see.

1. Scope, method and evidence labels

This is a desk-based company and product appraisal. It is not a technical benchmark, code review, penetration test, financial audit or reference call. Evidence is labelled as follows:

- Vendor claim stated by the company itself (website, biography, marketplace listing).
- Third-party report press or registry information, which may still repeat management statements.
- Directory estimate modelled headcount or revenue from data aggregators (ZoomInfo, LeadIQ and others). Often inaccurate for small private firms.
- Assessment the reviewer's inference.

Screenshots were captured on 8 November 2026. Lumenore's live site places automated browsers behind a human-verification check, so its pages were retrieved by direct HTTP request and rendered locally. Content is unchanged; the floating chat widget and cookie banners have been hidden for legibility. LinkedIn profiles are cited as published on each company's own leadership page. Their contents were not accessed, because LinkedIn requires sign-in.

2. Lumenore — company and products

2.1 Company profile

Item	Finding
Legal entity / HQ	Lumenore Inc., 999 Tech Row, Madison Heights, MI 48071, USA (site copyright and structured data). Vendor claim
Origin	The company's About page timeline shows **Netlink founded in 1998** and **"Netlink's BI practice becoming Lumenore in 2011"**, with further Lumenore milestones in 2016 and 2019 and "28 years of experience". Netlink is a Michigan IT, supply-chain and business-process services provider with "delivery centres and a global operations hub". Vendor claim
Ownership and funding	No venture or institutional rounds found. The company appears to be founder-owned and funded by the Netlink group. Assessment Confirm the shareholding, the contracting entity, and who owns the product IP (Lumenore Inc. or Netlink).
Scale	ZoomInfo: 11–50 employees, ~US$5.6m revenue. Latka lists ~3,500 employees, almost certainly Netlink group-wide or erroneous. Directory estimate Site: "Trusted by 100+ Teams Across Global Enterprises"; logos shown include SiriusXM and Birlasoft.
Go-to-market	Free-forever tier and sales-led enterprise deals. A previously announced exclusive APAC channel partnership with Apar Technologies (Singapore) targeted the education sector (publication year unconfirmed). Third-party report
Sector emphasis	Healthcare (CareGrid product line, HIPAA badge, APAC hospital case study), government, retail, gaming and logistics case studies. Assessment Healthcare and the public sector may be where the product is strongest.

2.2 Leadership

Name	Role	Published background / note

Anurag Shrivastava LinkedIn	Founder & CEO	"Founded Lumenore to make enterprise-grade analytics accessible to every business user... years of experience building data platforms for global enterprises." Also listed as founder and CEO of Netlink (ZoomInfo). No detailed career history is published.
Saurabh Mishra LinkedIn	Chief Technology Officer	Leads engineering, platform architecture and scalability.
Avani Shrivastava LinkedIn	VP, Growth & Strategy	Growth, partnerships and product-market alignment.
Sailendra Kumar GS LinkedIn	VP, Product Delivery	Release quality and delivery predictability.
Arun Sahu LinkedIn	AVP, Product	Product direction for self-service analytics.
Devendra Mehra LinkedIn	Senior Director, Product Delivery	Delivery processes and engineering execution.
Kashish Keswani LinkedIn	Director, Sales	Leads the sales team.
Harshit Saxena, **Alok Kumar Gupta**	Associate Directors	Operations and key initiatives.

Assessment. The published team is weighted towards product delivery and engineering. There is no named CFO, CISO, data protection officer or customer-success lead, which is notable for a vendor displaying SOC 2 and HIPAA badges. Biographies are generic, with no prior employers or education given, so leadership experience cannot be verified from public material. The VP Growth & Strategy shares the founder's surname. Any family relationship is unconfirmed, but in a founder-owned business it is worth understanding governance and succession arrangements.

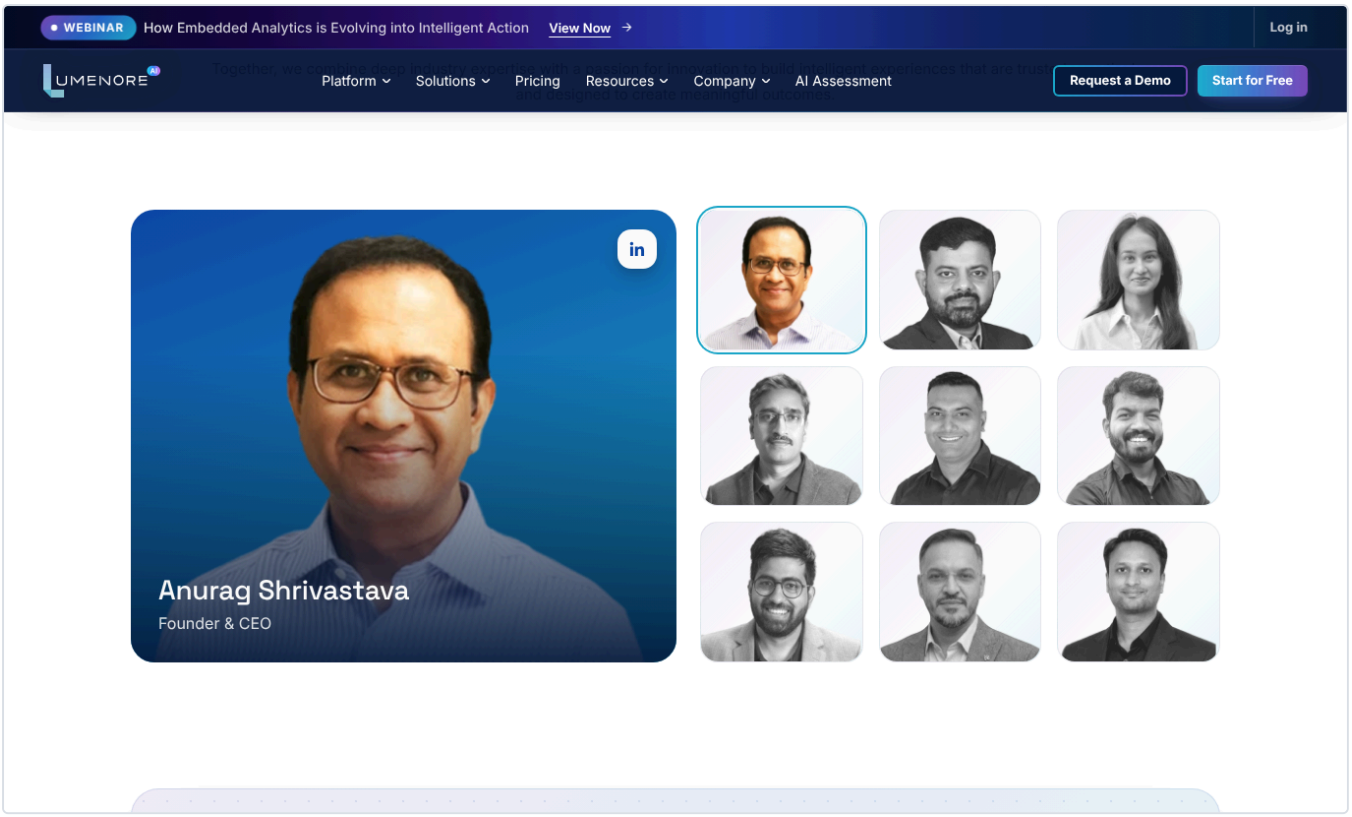

Figure L5. Lumenore About page: leadership team (lumenore.com/about-us, 8 Nov 2026).

2.3 Products and services

Product	What it is	Maturity signal
Ask Me	Conversational analytics over databases and documents; described in the FAQ as "an MCP-powered Agentic Analytics Platform"; "Agentic RAG"; bring-your-own approved LLM.	The product page invites users to "be among the first to experience the new Lumenore Ask Me", which suggests early access. **Confirm GA status per tier.**
Insights	Dashboards, autonomous insights and alerts; "100+ charts and graphs".	Long-standing core BI capability.
Data Magnet	Pipelines, ETL and data preparation.	Documented in the help centre.
CareGrid, IMPACT	Listed under Platform navigation; not explained on the homepage.	Likely vertical or solution offerings. Ask for scope and customer counts.
Services	"Talk to an Expert", "AI Assessment"; custom connectors and tailored models on the Custom tier; access to parent-group delivery resources.	Ask what proportion of a typical contract is services rather than licence.

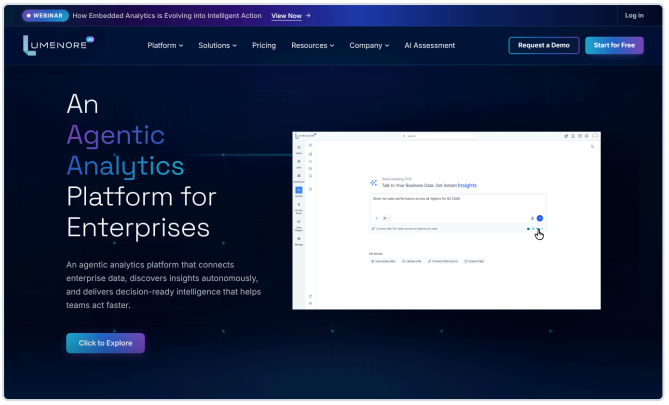

Figure L1. Homepage hero: "An Agentic Analytics Platform for Enterprises"; "Connect with 50+ data sources".

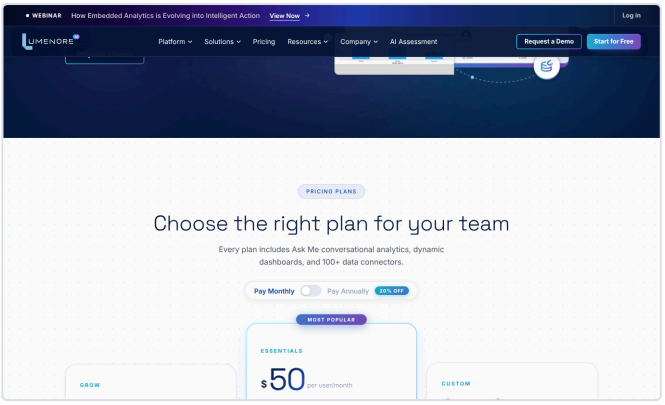

Figure L4. Pricing page: "100+ data connectors"; Essentials at US$50 per user per month.

2.4 Pricing in context

Offer	List price (per user / month)	Notes
Lumenore Grow	Free	2 users, 1m rows, 2 dashboards, 300 AI credits; files and RDBMS only.
Lumenore Essentials	US$50 (or US$480 per year)	5–20 users, 30m rows, AI credits, APIs and SaaS connectors.
Microsoft Power BI Pro	≈ US$14	Often already bundled in Microsoft 365 E5. Copilot features need Fabric capacity.
Lumenore Custom	Quote	20+ users, cloud or on-premise, custom AI credits.

Assessment. At roughly 3.5 times Power BI Pro's list price, Lumenore must justify itself on time-to-insight, ease for non-analysts and AI quality, not on cost. Its credible entry points are organisations without an existing BI estate, or teams for whom the conversational layer measurably cuts analyst workload. AI-credit consumption makes the total cost less predictable. (Competitor prices are list prices at the review date; confirm current terms.)

2.5 Security and compliance: claim versus evidence

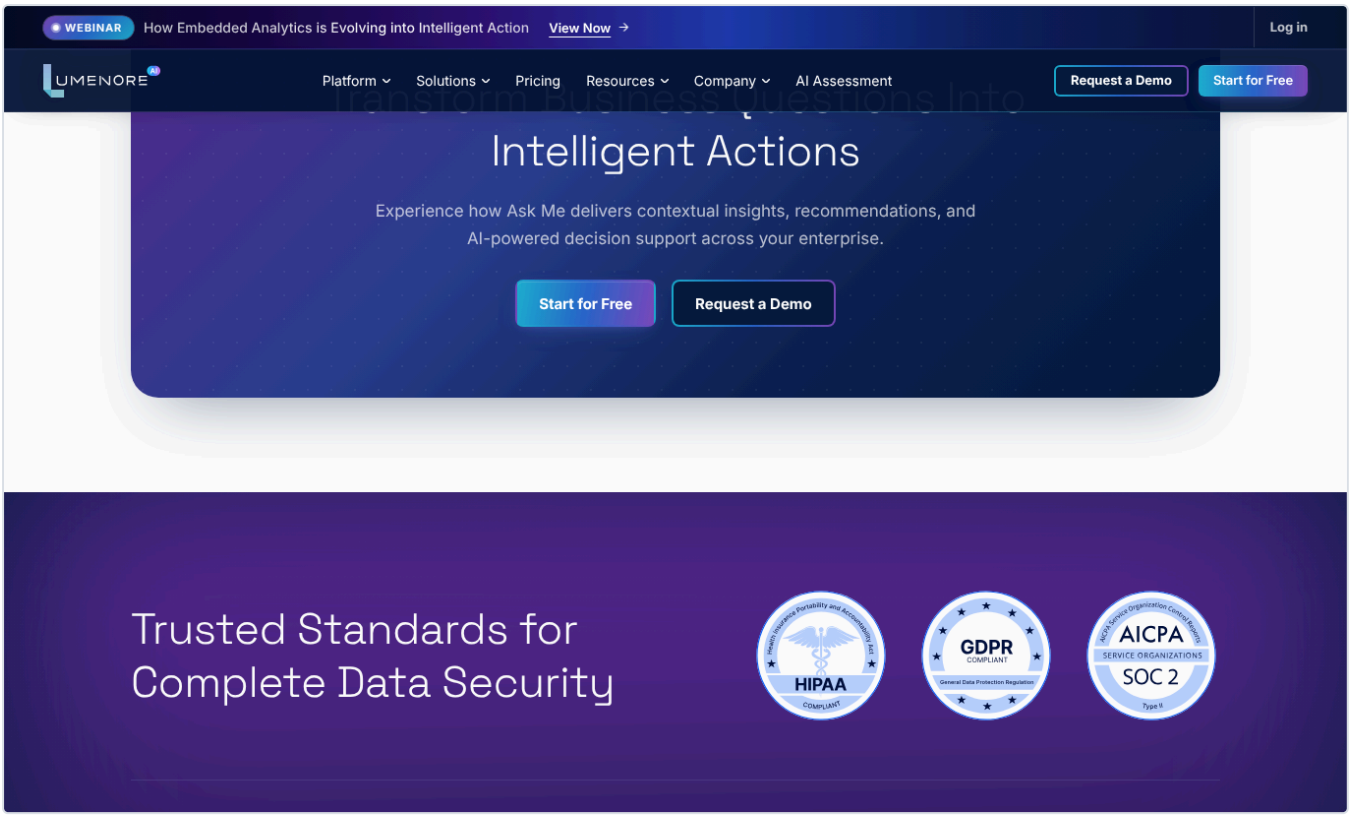

Figure L2. Ask Me page, "Trusted Standards for Complete Data Security": HIPAA, GDPR and AICPA SOC 2 badges. The badges are images and do not link to supporting documents.

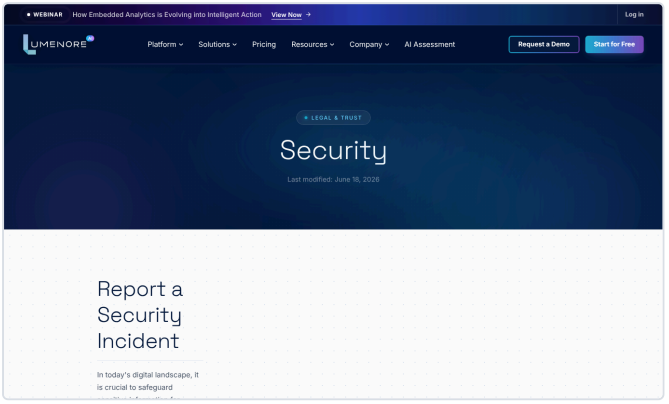

Figure L3. lumenore.com/security (last modified 18 June 2026) covers incident reporting and whistle-blowing only.

Evidence gap. The SOC 2 badge does not say whether the report is Type I or Type II, its period, its scope (Lumenore or Netlink, which products) or the auditor. "HIPAA Compliant" is not a certification. Evidence should be a signed Business Associate Agreement plus a description of the controls. "GDPR Ready" is a self-assessment.

Request under NDA: the current SOC 2 Type II report and bridge letter; a pen-test summary from the last 12 months; the sub-processor list (including LLM providers); the DPA; data-residency options; and whether prompts or data are retained or used for training.

2.6 Strengths and weaknesses

Strengths

- 15-year product lineage and a services parent: unlikely to disappear abruptly.
- Free tier allows a genuine evaluation at no cost.
- A single platform covers data preparation, dashboards and conversational analytics.

Weaknesses / uncertainties

- Small installed base and review sample after 15 years.
- Repositioning to "agentic" while the flagship feature appears to be in early access.

- Bring-your-own-LLM option suits organisations with an approved AI provider.
- Vertical depth in healthcare and the public sector.

- Product breadth (five lines) is large relative to the apparent team size.
- Compliance badges with no published evidence behind them.
- Premium pricing against bundled incumbents; consumption uncertainty from AI credits.
- Inconsistent public figures (50+ vs 100+ connectors).

3. Mojro — company and products

3.1 Company profile

Item	Finding
Legal entity	Mojro Technologies Private Limited, incorporated 23 May 2016, Karnataka (CIN U72900KA2016PTC093491). The website timeline shows "Mojro is born" in 2015, probably the pre-incorporation start. Third-party report
Funding	US$5.5m Series A, made up of a US$3m round led by IAN Alpha Fund (some databases label it a seed round, Feb 2026) and a US$2.5m extension (Business Standard, 28 Apr 2026). The site names IAN Group and Dallas Venture Capital, with 1Crowd and existing angels participating. Third-party report
Scale	24 employees (Mar 2024) to ~46 across two continents (Apr 2026); ZoomInfo 11–50. Revenue: ~US$0.74m FY2023 (registry-derived) vs US$10.1m (ZoomInfo, modelled). Directory estimate **Indian filings are public. Obtain FY24 and FY25 accounts from the Ministry of Corporate Affairs to settle this.**
Markets	More than 60% of revenue from overseas, including the US, Malaysia, Singapore and the Philippines (Entrepreneur). Site lists South and Southeast Asia, North America, the Middle East and Africa; SEA entries into Singapore, the Philippines, Indonesia and Thailand. North America is described as the "primary growth engine". Vendor claim
Named customers	Godrej (incl. Rianti Tan, Director of Logistics & Branch Operations), Hindustan Unilever / Unilever, Akshayakalpa Organic (Shashi Kumar, co-founder and CEO), Jersey dairy brand. Vendor claim
Channels	Microsoft commercial marketplace listing; partnerships with "leading US consulting and technology firms"; diagnostic engagements alongside consulting firms.

3.2 Founders and leadership

Name	Role	Published background (Mojro About page unless stated)
Kishan Aswath LinkedIn	Co-founder & CEO	B.E. Electronics & Communication, University of Mysore; Diploma in Advanced Computing, CDAC. Nearly 30 years in technology: Tata Infotech, then 10+ years at **Mindtree** rising from engineer to programme director (Chairman's Award), then led the enterprise architecture group at **Happiest Minds** (2011–2016, per third-party profile). Sets strategy and personally leads Southeast Asia.
Amit Ashok Kulkarni LinkedIn	Co-founder & CTO	B.E. Mechanical Engineering. Former chief architect and head of big data at **Mindtree** (Chairman's Award); earlier at Cordys. At Mojro he is CTO, **chief product officer and head of US business**, and also leads the AI innovation lab.
Ranganath Seetharamu LinkedIn	Co-founder & COO	B.E. Computer Science; PMP; Executive General Management Programme, IIM Bangalore. Delivery career at **Mindtree** across three continents. Owns India growth and global customer relationships. A previous Mojro team page also listed him as co-founder of Mela Ventures (titles there showed "CCO").

Manjunatha Nakshathri LinkedIn	Head of Engineering	B.E., M.Tech. 20+ years: Mindtree, Sapient, Tesco, Happiest Minds, Khosla Labs, Intuit. About a decade at Mojro.
Dhirender Beniwal LinkedIn	Director, Sales	B.Tech IIT Madras; MBA IIM Bangalore. Eight years at Mojro; opened four geographies (SG, PH, ID, TH) and closed large Indian enterprise deals.
Balaji Subudhi LinkedIn	Director, Sales	Postgraduate in robotics and AI; previously Infosys and Happiest Minds. Solution-led pre-sales.
Jeeshan Kohli LinkedIn	Director, Sales	BBA; PGP in AI/ML. 10+ years in people-mobility and logistics technology; manages consulting and SI partnerships.

Assessment. This is a cohesive, senior team with unusually long tenures for a start-up and a shared Mindtree background, which suggests strong enterprise-delivery discipline. Biographies are specific (employers, degrees, awards) and can be checked at reference calls. Weaknesses: there is no published logistics-operations or operations-research (OR) background among the founders, so solver depth should be tested, not assumed; the CTO holding three roles concentrates risk; and there is no named security, finance or customer-success leader.

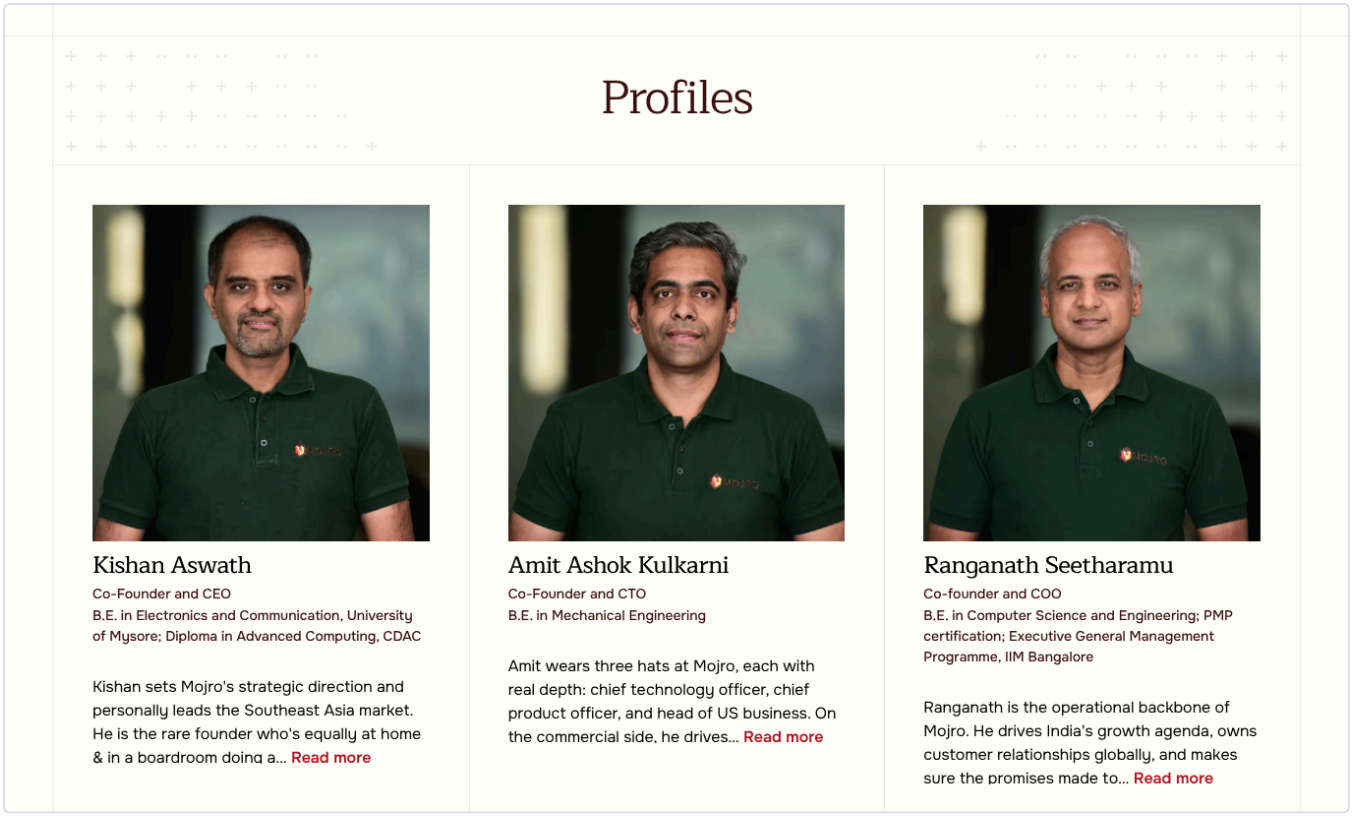

Figure M4. Mojro About page: founder profiles (mojro.com/about-us, 8 Nov 2026).

3.3 Products and services

Product	What it is
PlanWyse	Multi-constraint planning: route, schedule, trips, drops, space and weight solved "simultaneously as one equation"; "150+ interdependent constraints" across inbound, middle mile and last mile.
ExecuteWyse	Execution and visibility: GPS tracking, ETAs, ePOD, driver compliance, cash and crate reconciliation; delivery data feeds back into planning.

GeoWyse	Geospatial and territory capability (listed on the About page; not covered in v1). Ask for scope.
Services	Integration with an existing TMS or ERP ("a few days to a few weeks", per FAQ); diagnostic engagements with consulting partners; API documentation published.

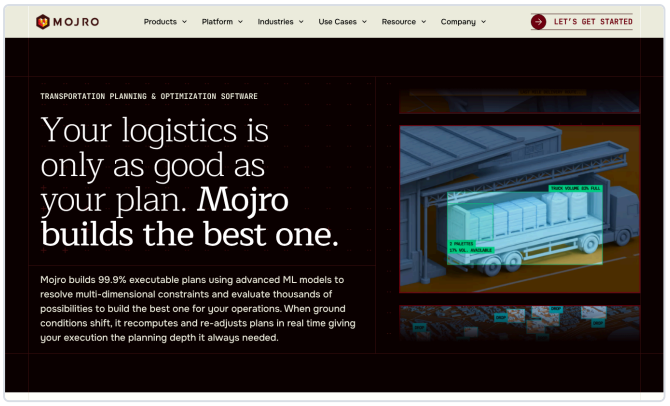

Figure M1. Homepage: "Mojro builds the best one", "99.9% executable plans using advanced ML models".

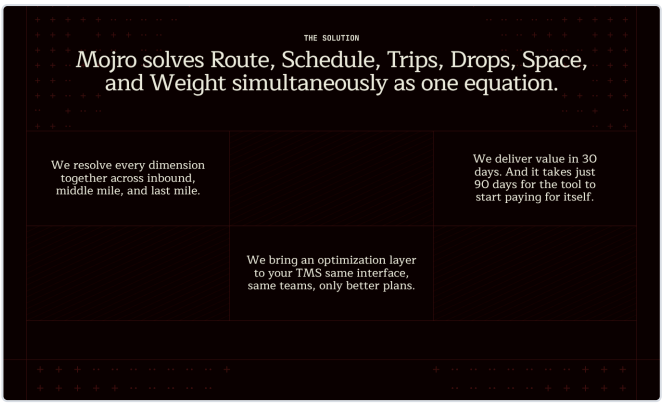

Figure M2. "Value in 30 days... 90 days for the tool to start paying for itself"; an optimisation layer on top of the existing TMS.

Figure M3. Named Godrej testimonials and Unilever and Akshayakalpa logos: stronger than anonymous logo walls, but still hosted by the vendor.

3.4 Claims requiring verification

- **99.9% executable plans**: no definition of "executable", sample or baseline. The figure also appears on the About page in hidden template markup next to placeholder ("Lorem ipsum") text. Visitors do not see it, but it shows the statistic was templated rather than sourced.
- **90% reduction in planning time; 30-day value; 90-day payback**: no linked methodology. Payback depends on the customer's cost base and must be modelled, not assumed.

- **12–15% average cost optimisation** (Microsoft Marketplace) and "up to 20%" (investor material): use the low end, and only after a replay.
- **Case studies** are partly gated behind a request form.

3.5 Security and data protection

> **Corrected in v3.** v2 said Mojro published no security posture. That was wrong. The homepage and About page carry no security information, but the **Platform Capabilities page** states "SOC 2 Type II certified, report available under NDA", "ISO 27001", encryption, role-based access, audit logging and US production data residency (Figure M6). Two points remain: the ISO 27001 claim is worded as both "certified" and "Compliant" on the same page, and there is no trust centre, certificate number or auditor. The platform processes customer addresses, driver identities and live locations, which is personal data under GDPR, India's DPDP Act and US state laws. **Before any live-data pilot,** obtain the SOC 2 Type II report (check its period and scope), the ISO 27001 certificate and Statement of Applicability, a pen-test summary, the sub-processor list (mapping and cloud) and a DPA, and confirm residency options outside the US.

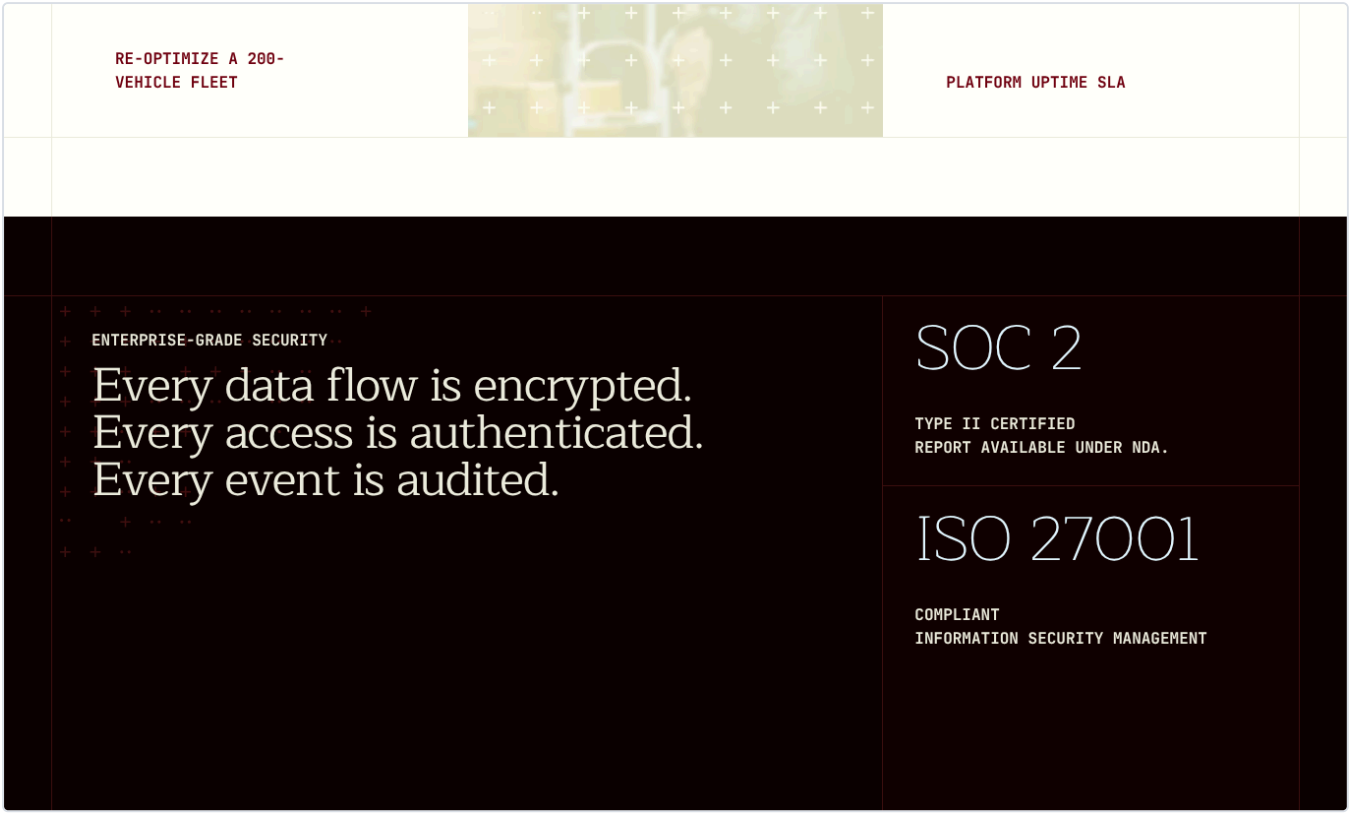

Figure M6. Mojro platform page: "SOC 2 Type II certified, report available under NDA"; "ISO 27001 Compliant" (mojro.com/platform-capabilities, 8 Nov 2026).

3.6 Competitive position and alternatives

Specialist alternatives include Locus, LogiNext, FarEye, ORTEC, OptimoRoute, and routing modules in TMS suites (e.g. Oracle, Blue Yonder, SAP). For organisations with an in-house OR or data-science team, **building on OR-Tools or Timefold** is a credible alternative. Mojro's background in Indian FMCG and dairy (dense, many-drop routes with crates and cash collection) is a strength in comparable operations. It is less proven against North American and European regulation (hours-of-service rules, tachographs, low-emission zones), which should be tested explicitly where relevant.

Strengths

- Narrow, measurable problem with a clear economic buyer.
- Experienced, stable founding team with enterprise-delivery heritage.
- Named enterprise references and recent independent funding.
- Works alongside an existing TMS, so displacement risk is low.
- International revenue base (more than 60% overseas).

Weaknesses / uncertainties

- Very small team relative to its customer list and geographic footprint.
- Modest capital for a "global expansion" strategy; ten years to Series A.
- Security claims appear only on one page; ISO 27001 wording is inconsistent.
- Headline percentages are unverified; the 99.9% figure is templated.
- Likely concentration in a few large FMCG accounts (unconfirmed).

4. Side-by-side comparison

Dimension	Lumenore	Mojro
Customer problem	Finding, visualising and explaining business data	Costly or infeasible movement of goods under constraints
Value mechanism	Faster analysis, self-service, fewer ad hoc BI requests	Lower distance and cost, higher utilisation, better service levels
Ability to verify ROI	Moderate; causal impact is hard to prove	High in principle through historical replay
Company maturity	15-year product within a 28-year services group	10-year start-up, Series A
Capital model	Parent-funded (assessed)	Venture-funded, US$5.5m Series A
Team signals	Generic biographies; delivery-weighted	Specific, verifiable biographies; long tenure
Trial accessibility	Free tier	Sales-led demo or negotiated pilot
Security evidence	Badges displayed; no reports published	SOC 2 Type II claimed (report under NDA); ISO 27001 claimed
Competitive pressure	Very broad horizontal BI market	Numerous specialist routing vendors, plus build-your-own
Principal failure mode	Confident but wrong or unauthorised AI output	Unworkable plans, or savings lost to implementation reality

5. Market landscape and competitor analysis

Competitor positioning reflects each vendor's public product positioning at the review date. It is an **assessment** for orientation, not a feature benchmark. Confirm specifics with the vendors.

5.1 Lumenore: the conversational and "agentic" analytics market

The market has split into three groups. **Platform incumbents** are adding AI to large existing estates. **Data-platform vendors** now offer natural-language querying directly on the warehouse, which makes a separate BI layer optional for some uses. **Independent AI-first BI vendors** compete on ease of use and price. Lumenore sits in the third group, and the second group is the bigger threat to it.

Competitor	Natural-language / agentic offer	Where it beats Lumenore	Where Lumenore can compete
Microsoft Power BI + Fabric	Copilot in Power BI / Fabric; data agents	Distribution through Microsoft 365, low per-user price, Entra ID governance, huge partner ecosystem	Organisations without Fabric capacity; teams that want conversational analytics without a Fabric programme
Tableau (Salesforce)	Tableau Pulse; Agentforce for analytics	Visual analytics depth; Salesforce CRM data integration	Cost; simpler deployment for non-Salesforce mid-market
ThoughtSpot	Spotter (AI analyst); search-first since inception	Most direct like-for-like rival; mature NLQ on cloud warehouses; enterprise references	Price and free tier; bundled ETL (Data Magnet) for customers without a warehouse
Qlik	Qlik Answers; associative engine	Large installed base; data-integration portfolio (Talend)	Simplicity; lower entry cost
Google Looker	Gemini in Looker; conversational analytics	LookML semantic layer and governance; BigQuery integration	Non-Google estates; business-user simplicity
Databricks AI/BI Genie, **Snowflake Cortex Analyst**	Natural-language querying inside the data platform	No extra BI licence; data never leaves the platform; strong governance	Customers *not* on these platforms; blended document-plus-database questions
Zoho Analytics, **Domo**	Zia assistant; Domo AI	Zoho: price and SMB reach. Domo: app and data-product breadth	Healthcare vertical depth; bring-your-own LLM

Competitive assessment. Natural-language querying is quickly becoming a standard feature that incumbents give away inside existing licences. Lumenore's defensible ground is therefore **not "chat with your data"**. It is (a) organisations without a modern warehouse or BI estate, where bundled ETL, dashboards and chat in one product matter; (b) vertical solutions (healthcare, public sector) where domain packs beat horizontal tools; and (c) acting as a data back-end that outside AI assistants call through MCP (Section 7).

5.2 Mojro: logistics planning and optimisation

Competitor	Type	Where it beats Mojro	Where Mojro can compete
Locus (India)	Dispatch and route optimisation, last-mile focus	Larger funding, brand and global sales footprint; strong last-mile execution	Joint route-load-space-weight planning across inbound, middle and last mile; constraint depth
LogiNext (India)	Field-force and delivery management SaaS	Breadth of modules; established in the Middle East and US	Planning depth for complex primary and secondary distribution
FarEye (India / US)	Delivery-experience and visibility platform	Customer-experience tooling; large enterprise retail and parcel base	Optimisation quality as the core product rather than an add-on
Shipsy (India)	Logistics execution and carrier management	Carrier, freight and cross-border breadth	FMCG / dairy multi-drop planning
ORTEC (NL), **Descartes** (CA)	Established optimisation and routing vendors	Decades of OR pedigree, global references, broad compliance coverage (EU / NA driver rules)	Speed of deployment, cost and flexibility for emerging-market operations
SAP TM, Oracle OTM, Blue Yonder	TMS suites with built-in optimisation	Already licensed by large enterprises; single-vendor stack	Positioned as a planning layer *on top* of these (certified SAP and Oracle connectors), so it complements rather than replaces them
OptimoRoute, Routific, Onfleet	Self-serve SMB routing	Price, instant sign-up	Enterprise constraint complexity well beyond SMB tools
Build: OR-Tools, Timefold, Nextmv, Gurobi	In-house optimisation	No vendor lock-in; full control	Time to value, maintained constraint library, execution app, address intelligence

> **Competitive assessment.** Mojro's clearest position is as the **optimisation brain beside an existing TMS or ERP**, rather than a full TMS. That avoids head-on competition with SAP and Oracle and turns them into channels. Its main exposure is to well-funded Indian peers (Locus, FarEye, LogiNext) that sell into the same FMCG accounts, and to TMS suites improving their native optimisers.

6. Market fit: where each product is likely to be strong

Segment	Lumenore	Mojro
Best-fit customer	Mid-market or departmental buyer, 20–500 analytics users, no mature BI estate, data in files and RDBMS or SaaS apps, wants dashboards plus chat in one product	Enterprise or upper mid-market shipper or 3PL running 50–1,000+ vehicles with multi-drop, time-window, capacity and mixed-fleet constraints; existing TMS or ERP

Strong verticals	Healthcare providers (CareGrid, HIPAA positioning, hospital case study); government and public agencies; contact centres (high-volume event data, per the Vertica case study)	FMCG and consumer-goods distribution; dairy and fresh food (perishability, crates, cash collection); retail replenishment; 3PL; parcel
Strong geographies	US (entity and HQ); India and APAC (team, channel partners)	India; Southeast Asia (SG, PH, ID, TH); emerging-market distribution where addresses are unstructured; growing US presence through SI partners
Weak fit	Enterprises standardised on Power BI, Tableau or Looker; warehouse-centric firms already using Genie or Cortex; heavily regulated finance without published assurance	Small fleets (SMB tools are cheaper); pure long-haul FTL brokerage; EU operations dependent on tachograph and driver-hours rules (unproven)
Buying trigger	Analyst backlog; new data initiative without an incumbent; desire to give AI assistants governed data access	Fleet cost pressure; network growth; dispatcher dependency; SLA failures; TMS that lacks a good optimiser

7. Underlying technology (inferred)

Inferred from company documentation, a published vendor case study, an open-source repository, job postings (dates not always visible) and website fingerprinting. Treat as indicative and confirm in an architecture review.

7.1 Lumenore

Layer	Evidence	Implication
Analytical engine	OpenText (Vertica) customer story: Lumenore moved to **Vertica**, reporting ~90% performance improvement. It runs customers on **one large multi-tenant Vertica cluster**; one contact-centre client streamed ~30 GB per hour. Vertica now redirects to Rocket Software, indicating another change of ownership.	A proven columnar MPP engine suits high-volume event data. However, **shared-cluster multi-tenancy** makes tenant isolation a priority question, and the engine's ownership has changed hands (HP → Micro Focus → OpenText → Rocket), which is a supply-chain dependency to understand.
Data integration	Data Magnet ETL (48 doc topics); 81 connector topics including Redshift, Snowflake, Greenplum, ServiceNow; files and RDBMS on the free tier.	Bundled ETL is a differentiator for customers without a warehouse; connector depth by tier must be verified.
AI / LLM layer	Ask Me: "Agentic RAG", AI agents, root-cause analysis, "AI readiness score"; bring-your-own approved LLM; a third-party listing shows the free tier on **GPT-4o mini**.	Likely an orchestration layer over third-party foundation models, not proprietary models. Accuracy depends on semantic modelling and prompt design; data goes to the LLM provider unless BYO-LLM or private hosting is used.

Agent interoperability	Open-source **Lumenore MCP server** (GitHub: Lumenore-Platform/lumenore-mcp): Python 3.13, FastMCP, MIT licence, v1.0.0 (Jan 2026). Eight tools: metadata, NLQ-to-data, trend, prediction, outlier, correlation, change, Pareto. Client-credential auth. Listed as "inactive" on Glama.	Strategically significant: it lets Claude, Copilot or ChatGPT-style agents use Lumenore as a governed analytics back-end. Low community activity suggests early adoption.
Collaboration and embedding	Microsoft Teams sharing; "embedded objects"; scheduling and publishing.	Supports an embedded / OEM analytics play.
Web and go-to-market stack	WordPress (WordPress VIP CDN headers), HubSpot, Microsoft Clarity, Crisp chat, CookieYes; help, learn, community and preview sub-domains.	A conventional B2B marketing stack; the community and learning portals indicate a product-led growth intent.

7.2 Mojro

Layer	Evidence	Implication
Optimisation engine	"Operations research plus machine learning meta-modelling" solving route, schedule, trips, drops, space and weight jointly; "millions of computations per run". An OR-engineer posting attributed to a Bengaluru logistics-optimisation firm lists OR-Tools, Jsprit, Pyomo, Gurobi and CPLEX.	Most likely metaheuristics (e.g. large-neighbourhood search) for vehicle routing with pickups and capacity, with ML used to tune parameters, predict service times or warm-start solutions. **Assessment:** joint optimisation is a real technical claim, but solver quality is only provable by benchmark.
Explainability	"Every assignment comes with a plain-language rationale": binding constraints and rejected alternatives.	Addresses the main cause of failure in optimisation roll-outs, which is dispatchers overriding plans they don't trust. Likely constraint-trace reporting, possibly LLM-worded.
Address intelligence	A "custom small language model" parses enterprise addresses to rooftop-level coordinates; trained on India, US and SEA patterns.	A genuine differentiator in emerging markets, where poor geocoding ruins route quality. Ask about accuracy metrics and the fallback when geocoding confidence is low.
Application stack	Job postings: **Java / Spring Boot** (preferred) and Python back-end; **Kafka**; PostgreSQL, MongoDB, Redis, **ClickHouse**, Elasticsearch; **Azure**; React front-end.	An event-driven, polyglot architecture typical of a real-time execution platform. ClickHouse suggests a large telemetry / GPS analytics workload. Azure aligns with the Microsoft Marketplace listing and a potential co-sell route.

Integration	REST APIs and developer portal (devportal.mojro.com: APIs, SDKs, webhooks; documentation behind sign-in); certified connectors for SAP S/4HANA, ECC, Oracle ERP Cloud and EBS; telematics (GPS, fuel, sensors); external traffic, weather, carrier and port/rail data.	An SAP/Oracle certification story supports the "layer on top of TMS" positioning and SI-led sales.
Scale and operations claims	100k+ peak daily orders; 15k orders optimised in under 5 minutes; 200-vehicle re-optimisation in under 5 minutes; 99.9% uptime SLA; US production data residency.	Credible mid-to-large enterprise scale. Verify on your own data; the runtimes depend on constraint mix.
Security claims	Platform page: "SOC 2 Type II certified, report available under NDA"; ISO 27001 described as both "certified" and "Compliant"; encryption, RBAC, audit logging.	See correction in Section 3.5. Obtain the report and the ISO certificate and check the scope.
Web / corporate stack	Webflow site behind Cloudflare; HubSpot; Microsoft Clarity; greytHR (HR / payroll).	Conventional; greytHR is consistent with an India-centred workforce.

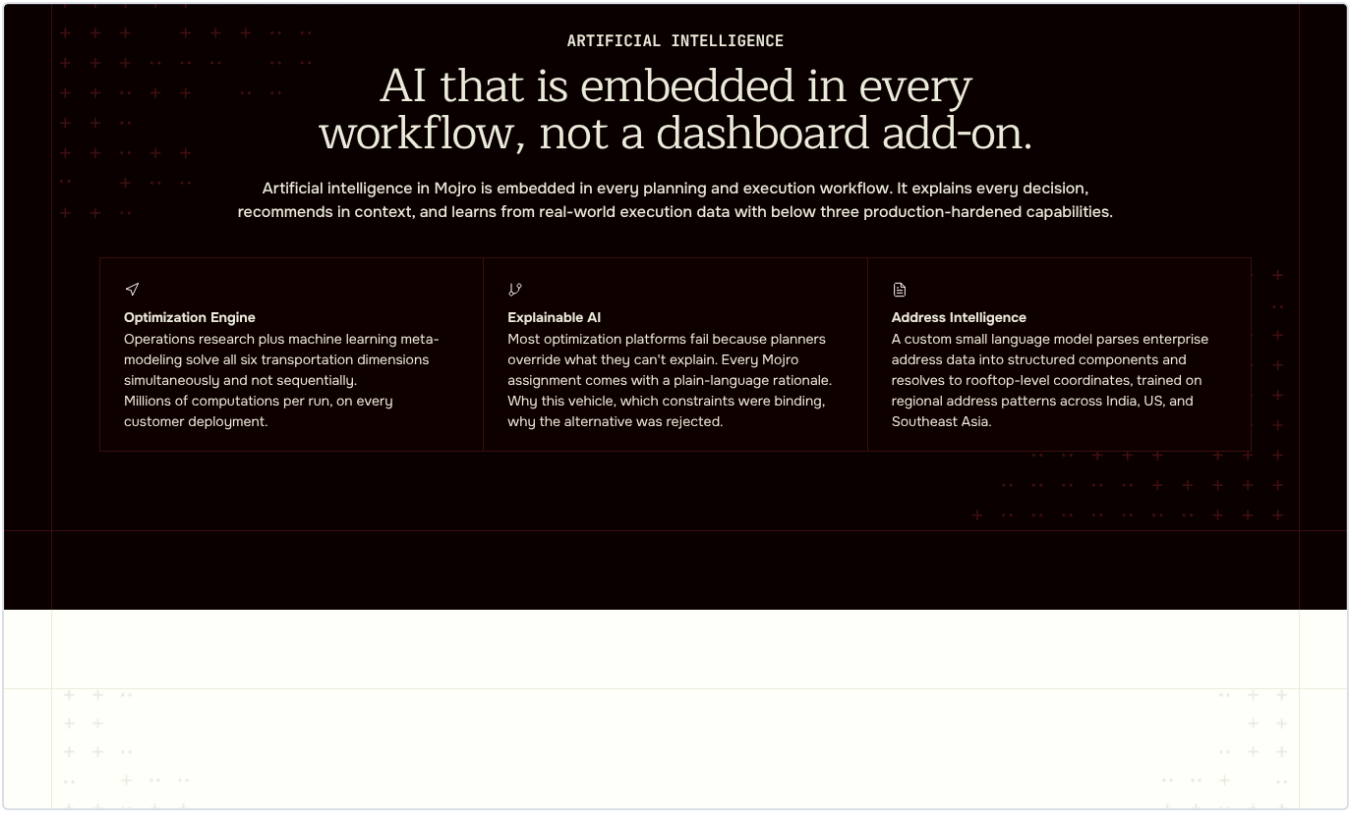

Figure M5. Mojro platform page: optimisation engine ("operations research plus machine learning meta-modelling"), explainable AI and address intelligence (mojro.com/platform-capabilities, 8 Nov 2026).

8. Strategic directions

8.1 Where Lumenore could be strong

#	Direction	Rationale	Proof points to look for

1	**Governed analytics back-end for AI agents**	The MCP server already exposes NLQ, trend, prediction, outlier and correlation tools. As enterprises adopt Claude, Copilot and ChatGPT agents, a governed, permission-aware analytics service is more defensible than another dashboard UI.	Row-level security enforced through MCP; enterprise MCP customers; an actively maintained repository
2	**Vertical solutions (healthcare, public sector)**	CareGrid and HIPAA positioning, hospital and government case studies. Vertical data models and KPIs are hard for horizontal incumbents to match.	Named healthcare customers; a signed BAA template; pre-built clinical and operational KPI packs
3	**Embedded / OEM analytics**	Embedded objects, multi-tenant architecture and the Netlink services channel suit ISVs that want analytics inside their own products.	OEM pricing; white-labelling; ISV references
4	**All-in-one for "no-warehouse" mid-market**	ETL, storage engine, dashboards and chat in one product removes the need to assemble a modern data stack.	Time-to-first-dashboard; free-to-paid conversion; data volume per tenant
5	**Trust as a feature**	Publishing a trust centre, SOC 2 Type II report and LLM data-handling policy would remove a key enterprise blocker cheaply.	A public trust portal; sub-processor list; model data-retention terms

Strategic threat. Hyperscaler and data-platform bundling (Copilot in Fabric, Genie in Databricks, Cortex in Snowflake, Gemini in Looker) shrinks the market for standalone natural-language BI. Lumenore must win where those platforms are absent, or become a layer they and AI agents call.

8.2 Where Mojro could be strong

#	Direction	Rationale	Proof points to look for
1	**Optimisation layer for SAP and Oracle estates through SIs**	Certified SAP and Oracle connectors and the "on top of your TMS" message make Mojro an add-on that SIs can attach to transformation programmes, which is a capital-efficient US route to market.	Named SI partners; SAP Store or Oracle Marketplace listings; joint deals
2	**Emerging-market distribution specialist**	Address-intelligence model, crate and cash reconciliation, dense multi-drop routes: problems that Western optimisers handle poorly. Natural expansion to the Middle East, Africa and Latin America.	Geocoding accuracy statistics; regional references beyond India and SEA
3	**Microsoft / Azure co-sell**	Azure-hosted platform and Marketplace listing; marketplace purchases can count against customers' Azure spend commitments.	Co-sell-ready / IP co-sell status; marketplace transactable offer
4	**From daily planning to strategic planning**	The same engine can support scenario planning, fleet sizing, depot placement and network design, which are higher-value, board-level decisions.	Scenario / what-if modules; network-design case studies

5	**EV fleets and emissions optimisation**	The site notes that fleet electrification adds range constraints. Charging-aware routing and carbon reporting are growing purchase criteria.	EV-range and charging constraints; Scope 3 emissions reporting
6	**Optimisation as an API**	A developer portal with APIs, SDKs and webhooks enables embedding into ISV, TMS and marketplace platforms.	Public API docs; usage-based pricing; ISV integrations

Strategic threats. Better-funded Indian rivals selling into the same accounts; TMS suites improving native optimisers; and falling build costs as open-source solvers and AI-assisted OR modelling make in-house builds easier for large shippers.

8.3 Implications for buyers, partners and investors

- **Buyers:** negotiate from strength. Both vendors are small and value marquee logos. Seek pilot-to-production price protection, reference-customer discounts and strong exit terms.
- **Partners / SIs:** Mojro is a credible attach product for SAP and Oracle logistics programmes. Lumenore suits embedded analytics in services-led deals.
- **Investors / corporate development:** *Assessment:* Mojro's profile (domain IP, certified ERP connectors, small team, enterprise logos) is typical of acquisition targets for TMS vendors, SIs or larger logistics-tech players. Lumenore's value is tied to its parent and is more likely to grow through partnerships and verticals than through outside funding.

9. Other insights

- **Lumenore runs every customer on one shared Vertica cluster** (vendor case study). This is efficient, but tenant isolation, noisy-neighbour performance and data-residency options must be confirmed. Ask whether dedicated clusters are available on the Custom tier.
- **Lumenore's AI economics depend on third-party LLM pricing.** AI credits are effectively a pass-through of model costs. Expect credit allowances and tiers to change as model prices move.
- **The Lumenore MCP server is MIT-licensed and public**, so a technical team can inspect how Ask Me is called, test it against the Grow tier, and gauge API maturity before engaging sales.
- **Mojro's claims are internally inconsistent in places:** integration "within the first two weeks" or "in days", "value in 30 days", "full deployment in 90", "90 days to pay for itself"; ISO 27001 "certified" vs "Compliant"; the hidden 99.9% placeholder. These are marketing hygiene issues rather than red flags, but each should be pinned down contractually.
- **Mojro's stated scale (100k peak daily orders) is consistent with several mid-to-large deployments**, not dozens of very large ones. That fits a ~40-person company and supports the capacity concern in Section 10.
- **Mojro's North America push rests on the CTO**, who also acts as CPO and head of US business. Ask how US delivery and support are staffed locally.
- **Both vendors use Microsoft Clarity and HubSpot** on their websites, so visitor sessions are recorded for analytics. That's normal B2B practice, but relevant if staff browse while signed into trial accounts.

10. Vendor risk register

#	Vendor	Risk	Rating	Mitigation / evidence required

1	Mojro	Support and implementation capacity across time zones	High	Named delivery team, support SLAs by region, partner-delivery model, escalation path in the contract.
2	Mojro	Security claims not yet evidenced to the buyer	Medium	SOC 2 Type II report under NDA (period, scope), ISO 27001 certificate, pen test, DPA; anonymised data only until satisfied.
3	Lumenore	Unauthorised data disclosure through Ask Me	High	Role-based red-team test (Section 12); RLS enforced across chat, SQL and documents.
4	Lumenore	Compliance badges not backed by reports	Medium	SOC 2 Type II report, scope, auditor; BAA if handling PHI.
5	Both	Vendor financial viability	Medium	Mojro: MCA filings FY24–FY25. Lumenore: management accounts under NDA. Source-code escrow and data-export rights for both.
6	Mojro	Key-person and customer concentration	Medium	Top-3 customer revenue share; deputy coverage for CTO/CPO/US roles.
7	Lumenore	Services-led revenue and unclear contracting entity	Medium	Confirm the signing entity, IP ownership, and the licence vs services split.
8	Lumenore	Cost unpredictability (AI credits, per-user premium)	Medium	Credit usage per query type; capped overage; TCO comparison against Power BI.
9	Mojro	Over-stated savings and payback	Medium	Blind replay against the incumbent and an OR-Tools baseline; fully loaded net savings.
10	Lumenore	Roadmap focus spread across five product lines	Low	Roadmap commitments for the modules being bought; Ask Me GA date.

11. Evidence quality summary

Public evidence	Interpretation	Follow-up
Lumenore pricing and free tier	Commercial terms visible; feature matrix subject to change	Confirm entitlements, credits, connector costs
Lumenore reviews (15 Gartner / 11 Capterra)	Directional sentiment; small sample	Two references from the same sector
Lumenore SOC 2 / HIPAA / GDPR badges	Claims without published evidence	Reports and BAA under NDA
Lumenore Netlink lineage	Stability signal; possible services dependence	Corporate structure and IP ownership
Mojro named testimonials	Plausible enterprise adoption; vendor-hosted	Speak to referees; confirm scope and tenure
Mojro Series A (Apr 2026)	Externally reported financing	Runway, burn, hiring plan
Mojro founder biographies	Specific and verifiable	Confirm at reference calls and on LinkedIn

Mojro performance percentages	Attractive but unverified; 99.9% templated	Blind replay, live observation
Headcount and revenue (both)	Directory estimates conflict	Registry filings or management accounts

12. Recommended Lumenore proof of concept (2–3 weeks)

Use the free tier on a small, representative, non-sensitive dataset with known answers. Move to a paid pilot only to validate the connectors and policies that matter. Define "correct" before looking at outputs.

1. Prepare 30–50 questions covering aggregations, joins, ambiguous time periods, filters, missing values, drill-downs, causal wording and conflicts between documents and the database. Keep a signed-off SQL answer key.
2. Test three roles (administrator, authorised user, restricted user). Attempt cross-department and cross-row questions, including multi-turn follow-ups.
3. Repeat with paraphrases. Record numerical correctness, completeness, sources, query lineage, refusal quality and consistency.
4. Measure setup time, latency, analyst intervention and AI-credit consumption, then project the annual cost at expected volumes against the Power BI baseline.
5. Interview 2–3 business users on whether they prefer the outputs and can verify them.
6. In parallel, obtain the SOC 2 report, DPA and sub-processor list, and confirm the contracting entity.

Gate	Proposed acceptance rule (agree before testing)
Data exposure	Zero unauthorised records or cross-role disclosures.
Numerical accuracy	At least 95% correct on deterministic numeric tests; no material error on board or financial KPIs.
Explainability	Every material answer traceable to a source, metric definition and calculation.
Assurance	SOC 2 Type II (or equivalent) received and scoped to the products in use.
Commercial viability	Written TCO covering licences, credits, connectors, support and services.

13. Recommended Mojro proof of value (4–6 weeks)

Start with a historical replay, then a controlled live pilot. Compare Mojro against both the current dispatch process and a fairly configured independent optimiser (for example, OR-Tools) on identical orders, assets, time windows and hard constraints.

1. **Pre-condition:** SOC 2 Type II report, ISO 27001 certificate, DPA and filed accounts received; use anonymised data until satisfied.
2. Collect 4–8 weeks of orders, stops, quantities, capacities, driver hours, actual travel, failed deliveries, windows and cost rates.
3. Separate hard constraints from soft objectives. No "savings" may come from breaking a hard constraint.
4. Run blind backtests on unseen periods, with independent checks of road feasibility, load and weight, and runtime.
5. Pilot with dispatchers and drivers. Record acceptance rate, overrides, exception recovery and behaviour under disruption.

6. Calculate fully loaded net savings after licences, mapping, integration, support and training.
7. Name the delivery team and support coverage for your time zone, and test it during the pilot.

Gate	Proposed acceptance rule (agree before testing)
Feasibility	Zero material legal or safety violations; agreed share of plans executable without manual rebuilding.
Financial benefit	Positive net benefit after all platform costs, clearly better than both baselines.
Service quality	On-time delivery and SLAs maintained or improved.
Vendor capacity	Support response met during the pilot; named escalation contacts.
Assurance	Security evidence accepted by your security team before live data is used.

14. Procurement and due-diligence checklist

Company and viability (both vendors)

- Contracting entity, ultimate ownership and IP ownership. Recent financial statements (Mojro's are filed with the Ministry of Corporate Affairs).
- Customer count, gross and net revenue retention, share of revenue from the top three customers.
- Headcount by function (engineering, support, implementation, security) and by region.
- Source-code escrow, full data and configuration export, termination assistance.
- Two production references in a comparable industry and geography.

Security and data

- Independent attestations (SOC 2 Type II, ISO 27001), scope and dates; pen-test summary.
- Hosting location, residency options, backups, encryption and key management.
- Sub-processors (LLM, mapping and cloud), data-transfer mechanisms, breach-notification terms.

Lumenore-specific

- Is Ask Me generally available on the tier being bought? Is policy enforcement identical across dashboards, generated SQL, documents and multi-turn chat?
- Can approved metric definitions be pinned and speculative answers disabled?
- What happens to prompts and retrieved data when a third-party LLM is invoked?
- Relationship with Netlink: who delivers services, and on what terms?

Mojro-specific

- Solver methods, and what happens when no feasible plan exists.
- Validation of loads, travel times and legal limits against ground truth.
- Coverage of hours-of-service, tachograph and low-emission-zone rules where relevant.
- Client-side process changes and data-cleaning obligations needed to reach the advertised benefits.

15. Recommendations and next decision

Lumenore is a reasonable, low-cost trial candidate for organisations without a mature self-service analytics environment, particularly in healthcare or the public sector. Proceed to enterprise procurement only after proving numerical correctness, permission enforcement, assurance evidence and total cost against the incumbent. Clarify the Netlink relationship before contracting.

Mojro offers the more differentiated proposition on the evidence: a narrow, measurable problem, a credible and experienced founding team, and named enterprise references. Its main risks are those of a small company (capacity, security maturity, capital), not the concept. Request filed accounts, security evidence and references first, then run the replay against both baselines.

Priority depends on the business problem. Improving information access points to Lumenore; reducing transport cost points to Mojro. There is no universal winner.

Practical 30-day plan

1. **Week 1:** agree the problem, metrics, data owners and privacy constraints. Send both vendors the viability and security request list.
2. **Week 2:** start the Lumenore free-tier evaluation; pull Mojro's MCA filings; book reference calls.
3. **Weeks 3–4:** complete the Lumenore answer-quality and permissions review; begin the Mojro historical replay if data and security pre-conditions are met.
4. **Decision meeting:** record observed results separately from vendor forecasts. Advance, extend or decline each vendor.
